Shopify Connector — Daily Use Guide

- The daily routine
- 1. Shopify Activities — your work list
- 2. Shopify Orders — from order to sales order
- 3. Shopify Products — what is linked to what
- 4. When an order does not become a sales order
- 5. Shopify Log Entries and Skipped Records
- 6. Before you hand over to the customer

How to run the Shopify Connector once it is set up: what to check each day, how orders become sales orders, and what to do when something does not come through. Setup is in the Setup Guide.

Screenshots come from a BC sandbox (company ORQA D.O.O.) connected to the Shopify dev store `croatia-test.myshopify.com`. All data in them is demo data; the customer *Test Kupac* is invented.

The daily routine

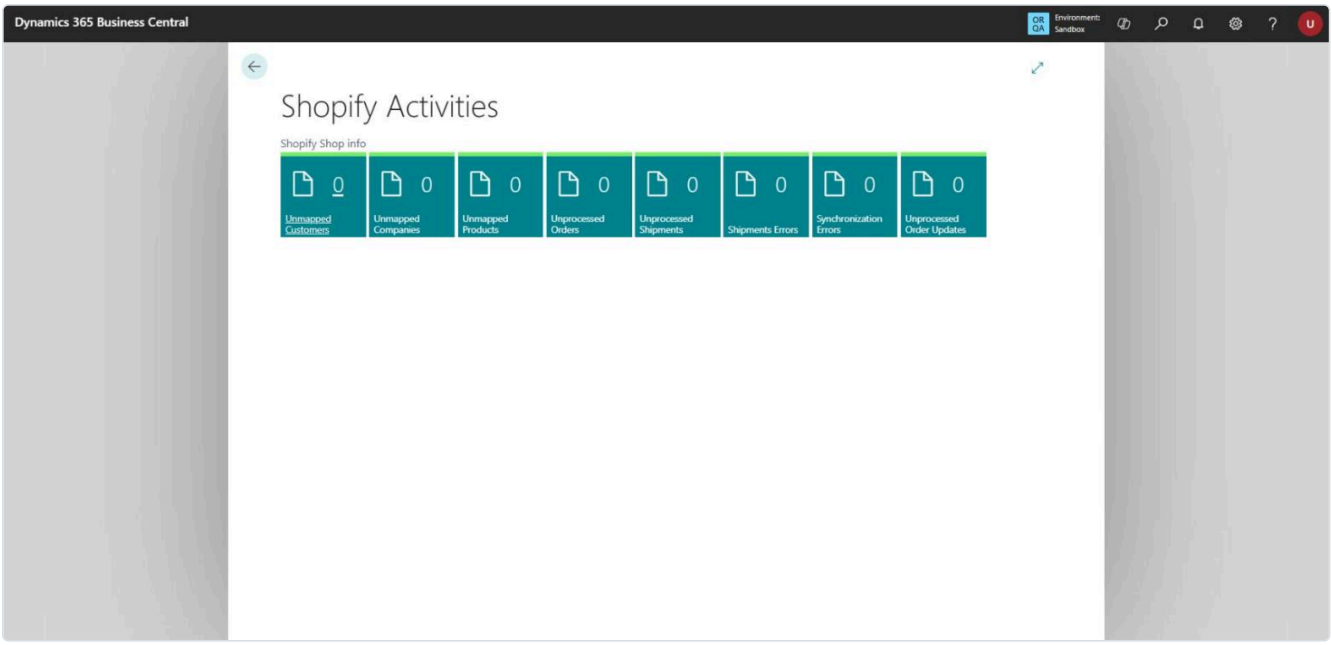

```
1. Shopify Activities ──► 2. Sync Orders ──► 3. Create Sales Documents ──► 4. Post / ship in BC ──► 5. Sync Shipments
   (check the cues)          From Shopify       (if not automatic)                                    To Shopify
```

Step	Where	What you do
1	**Shopify Activities**	Check every cue is 0. A non-zero cue is work for you — click it.
2	**Shopify Orders** → Home → **Sync Orders From Shopify**	Brings new and changed orders into BC.
3	**Shopify Orders** → Home → **Create Sales Documents**	Needed only when **Auto Create Orders** is off on the Shop card, or an order failed earlier.
4	Sales order in BC	Ship and invoice it the normal BC way.
5	**Shopify Orders** → Home → **Sync Shipments To Shopify**	Sends the posted shipment (and tracking number) back, so the order is fulfilled in Shopify.

When the job queue runs the synchronizations on a schedule, steps 2, 3 and 5 happen on their own; you then only do steps 1 and 4.

1. Shopify Activities — your work list

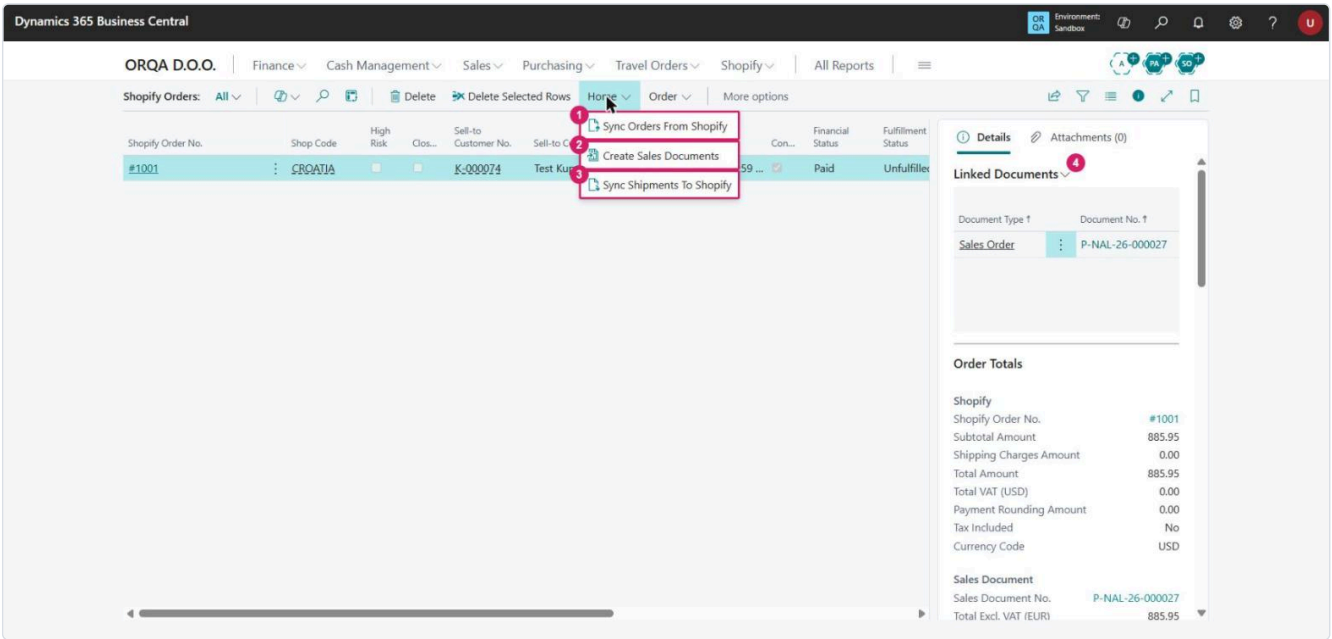

Search for **Shopify Activities** (or add the part to your Role Center).

Cue	Non-zero means	What to do
Unmapped Customers	Shopify customers with no BC customer	Open, then map to an existing customer or create one.
Unmapped Companies	B2B companies with no BC customer	Same as customers, for B2B.
Unmapped Products	Shopify products with no BC item	Open, then **Map Product** or **Create Item** (Shopify Products page).
Unprocessed Orders	Imported orders with no sales document yet	Open, fix the error on the order, then **Create Sales Document**.
Unprocessed Shipments	Posted shipments not yet sent to Shopify	Run **Sync Shipments To Shopify**.
Shipments Errors	Shipments Shopify rejected	Open the shipment, read the error, fix, sync again.
Synchronization Errors	A sync run failed	Open **Shopify Log Entries** (see §5).
Unprocessed Order Updates	An order changed in Shopify after BC created its sales document	Open the order, compare, then **Mark Conflict as Resolved**.

2. Shopify Orders — from order to sales order

Search for **Shopify Orders**.

#	Action / part	Use it to
1	**Sync Orders From Shopify**	Import new orders now instead of waiting for the job queue.
2	**Create Sales Documents**	Create sales orders (or invoices) for the selected orders.
3	**Sync Shipments To Shopify**	Send posted shipments back to Shopify.
4	**Linked Documents** (fact box)	See which BC document the order became; click to open it.

Columns worth adding to the view: **Has Error** and **Error Message** — an order that did not become a sales document says why here.

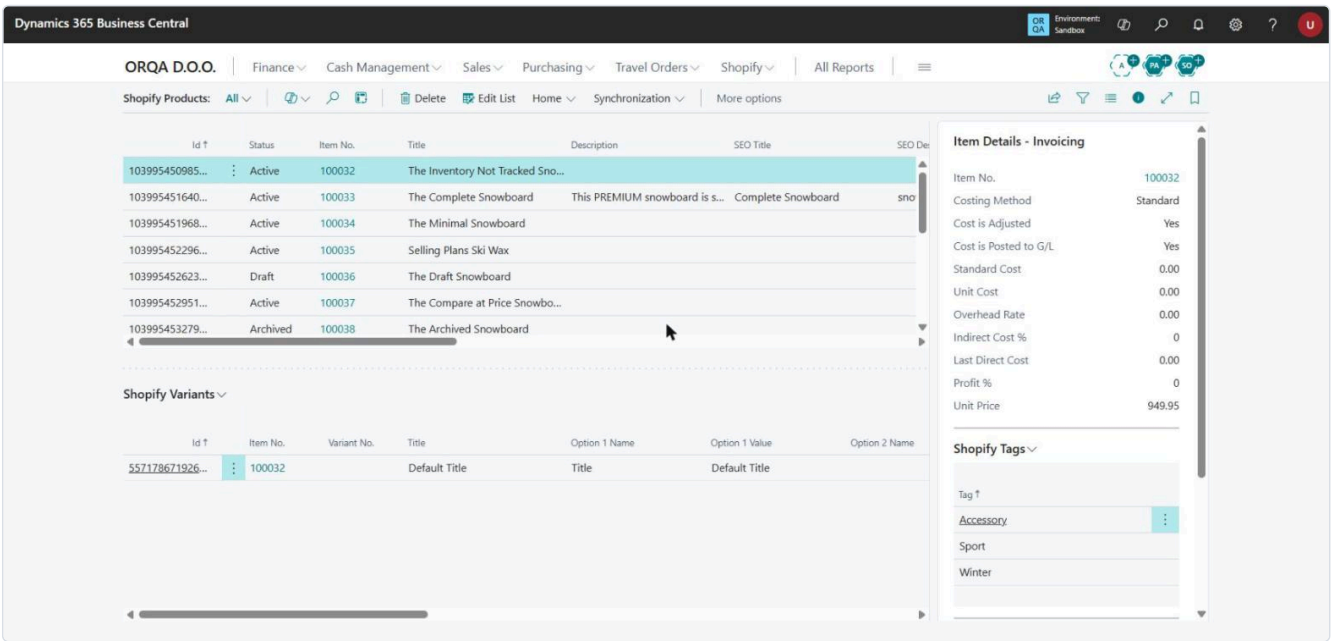

On one order (open it from the list)

Action	When
Find Mappings	After you fixed a customer or item mapping: re-checks the order lines and the customer.
Create Sales Document	Create the sales document for this one order.
Create New Customer	The customer is not in BC and the Shop card does not create customers on its own.
Mark as Paid	Payment was collected outside Shopify — marks the order paid in Shopify.
Cancel Order	Cancels the order in Shopify.
Unlink Processed Documents	Unlinks the order from its BC sales document (for example before creating it again).
Mark Conflict as Resolved	After you checked an order that changed in Shopify (cue **Unprocessed Order Updates**).
Sync order from Shopify	Re-read this one order from Shopify.
Transactions, **Shipping Costs**, **Fulfillment Orders**, **Refunds**, **Returns**, **Tax Lines**	Look at what Shopify sent — use them to explain a difference in amounts.

Check every new order against Shopify once: the total, the tax and the currency on the order card (fact box *Order Totals*) against the sales order. The test in the setup guide (Part 3, §3.4) found differences in all three when the Shop card's **Currency Code** and VAT settings were not set.

3. Shopify Products — what is linked to what

Search for **Shopify Products**.

- Each row is a Shopify product; **Item No.** is its BC item. An empty Item No. is an unmapped product.
- **Shopify Variants** (bottom) lists the variants; each one maps to an item or item variant.
- The **Map Product** and **Create Item** actions fix an unmapped product.
- **Synchronization** menu: sync **Products**, **Prices to Shopify**, **Product Images**, **Inventory**.
- **Status** comes from Shopify: *Draft* and *Archived* products are imported but not sold.

4. When an order does not become a sales order

Symptom	Likely cause	Fix
Order in **Shopify Orders**, **Has Error** = Yes	Customer or item not found	Read **Error Message**; map the customer / product, then **Find Mappings** → **Create Sales Document**.
Order is not in **Shopify Orders** at all	Not synced yet	Run **Sync Orders From Shopify**; if it still is missing, check **Shopify Log Entries** (§5).
Error about posting setup on the sales order (e.g. *Inventory Account is missing in Inventory Posting Setup*)	BC setup for the location in the locations mapping	Fix the posting setup for that location — a BC setup task, not a connector one.
Amounts differ from Shopify	Shop card **Currency Code** blank, or VAT / tax settings	Setup guide §3.4.
Order changed in Shopify after the sales order was made	Cue **Unprocessed Order Updates**	Compare, update the sales order by hand, **Mark Conflict as Resolved**.
Shipment not fulfilled in Shopify	Shipment not posted, or not synced	Post the shipment; **Sync Shipments To Shopify**; check **Shipments Errors**.

5. Shopify Log Entries and Skipped Records

- **Shopify Log Entries** shows each call to Shopify: URL, **Request Preview**, **Response Preview**, **Has Error**. What it records depends on **Logging Mode** on the Shop card:
  - **Error Only** (the default) — only failed calls. An empty log then means nothing failed.
  - **All** — every call. Use it while you diagnose a problem, then switch back: the log grows fast.
  - **Disabled** — nothing, and Skipped Records are not written either.
- Clean up with the actions that delete entries older than 7 days, or all entries.
- **Shopify Skipped Records** lists records a sync left out on purpose, with the reason (for example an item that is blocked). Read it when a product, customer or order is missing and Log Entries shows no error.

6. Before you hand over to the customer

- Shop card **Currency Code** set to the store's currency (when it differs from the BC local currency).
- VAT / tax settings checked against a real order (setup guide §3.4).
- Posting setup complete for every location in the locations mapping.
- Job queue entries for the syncs running, and someone owns the **Shopify Activities** cues.
