Shopify Connector — Setup and First Test

- Order of work
- 1. Create the Shop card
- 2. Connect the store
- 3. Products and inventory
- 4. Prices
- 5. Customers
- 6. B2B companies
- 7. Orders
- 8. Returns and refunds
- 9. Mappings
- 10. First synchronization
- Part 2 — First-time setup: the worked example
- Part 3 — Test an order end to end
  - 3.1 Create a test order in Shopify
  - 3.2 Import the order into BC
  - 3.3 Check the sales order
  - 3.4 What the test showed: fix before go-live

How to connect a Shopify store to Business Central and configure the Shop card for products, inventory, order-to-cash and B2B.

Audience	Consultants and implementers who know Business Central
Connector version	Shopify Connector 28.x
Worked example	BC sandbox `Sandbox`, company ORQA D.O.O. → Shopify dev store `croatia-test.myshopify.com`, shop code `CROATIA`

About the screenshots. They were taken in the BC sandbox on 2026-10-26. Steps 1–10 show the connector's **defaults**, captured before the store was connected. **Part 2** shows the values actually set for the worked example, and **Part 3** shows a test order going from Shopify into BC. Pink numbered badges match the numbered rows in the table under each screenshot. All customer data is invented.

Order of work

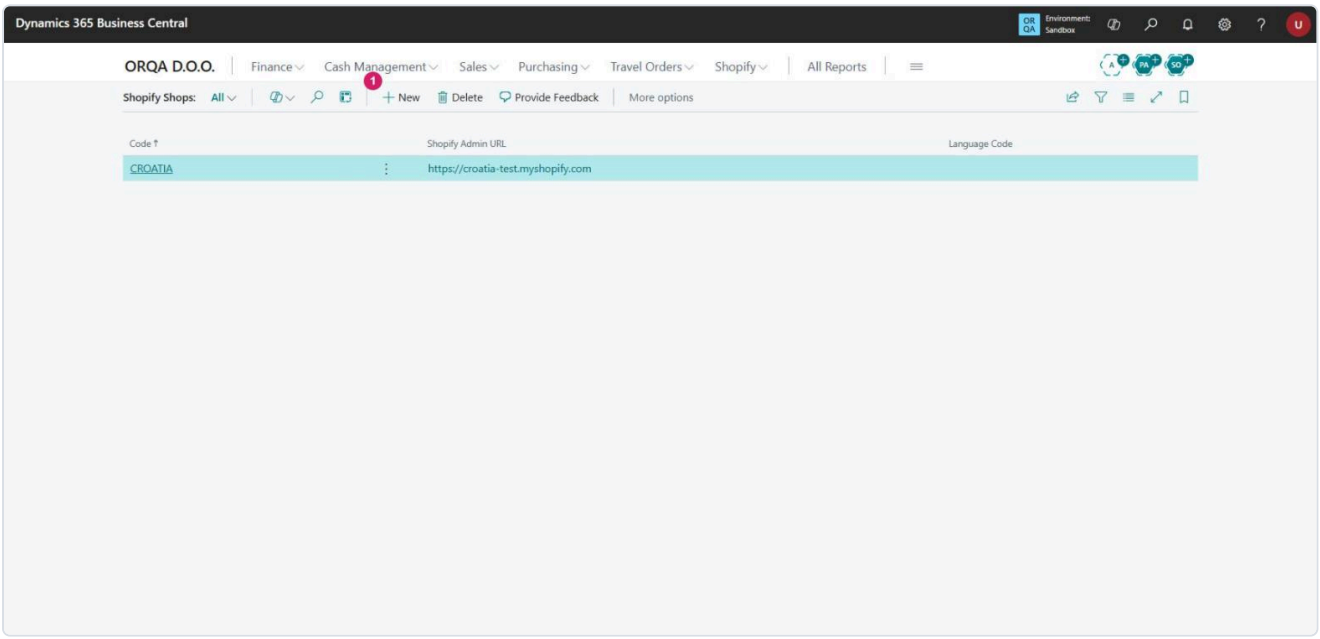

1. Create Shop card → 2. Connect: Enabled + consent → 3. Products & inventory → 4. Prices → 5. Customers → 6. B2B companies → 7. Orders → 8. Returns & refunds → 9. Mappings: locations, shipping, payments → 10. First sync

Before you start, have these ready in Business Central: an **item template**, a **customer template**, a **G/L account for shipping charges**, and the **locations** that hold stock you sell on Shopify.

---

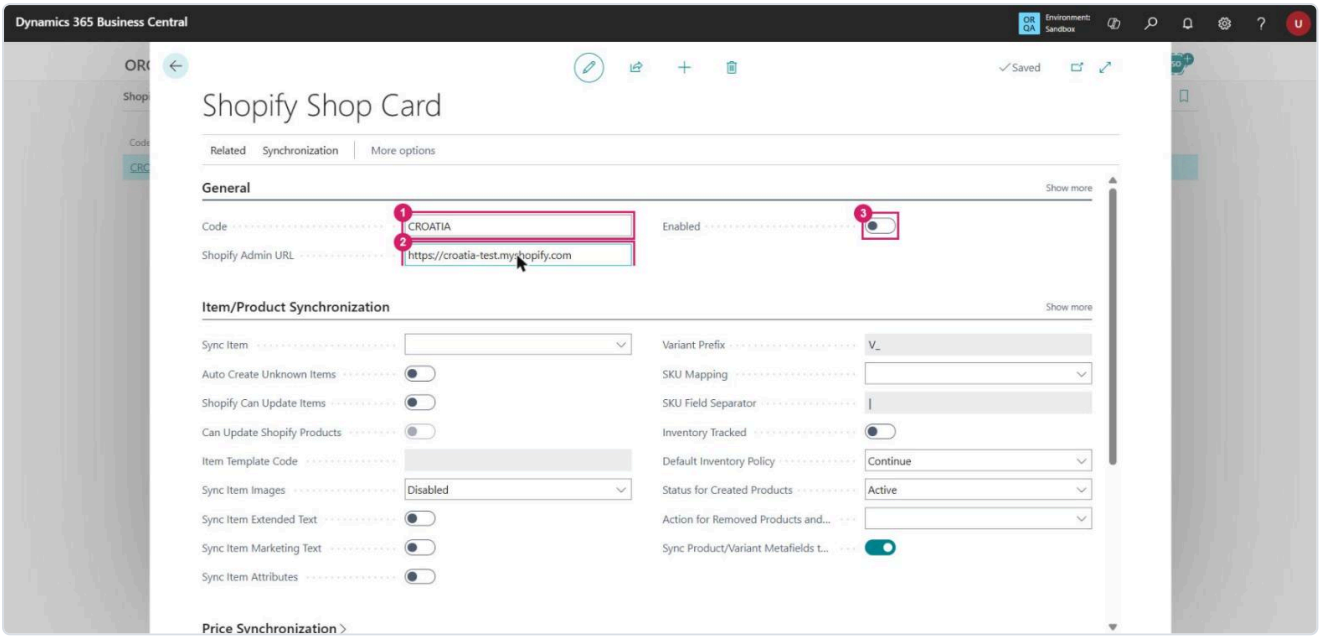

1. Create the Shop card

Search for **Shopify Shops** and choose **New**.

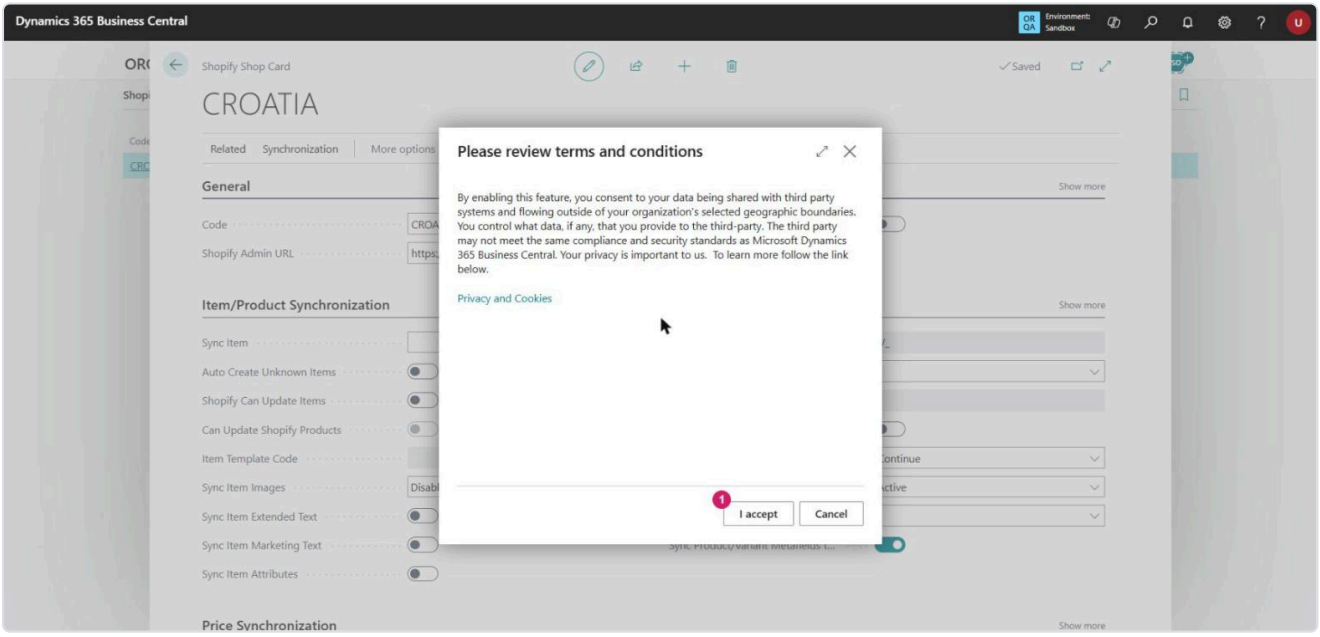

#	Action
1	**New** opens an empty Shopify Shop Card.

2. Connect the store

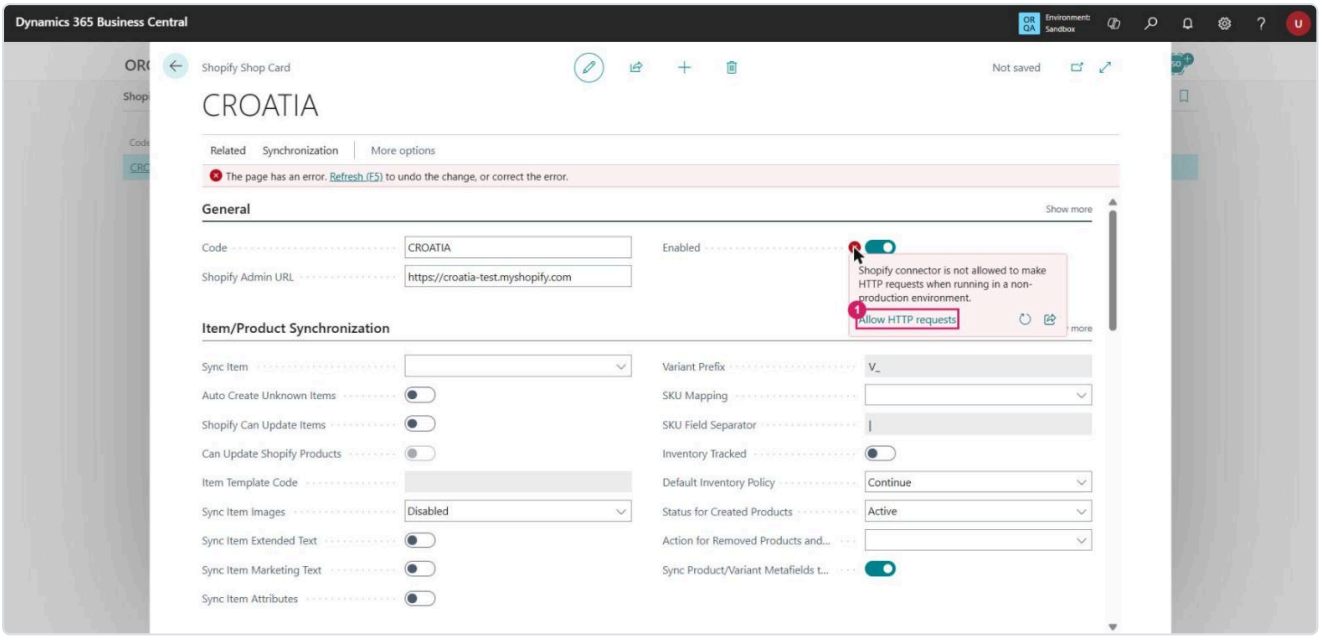

#	Field	What to enter
1	**Code**	A short code for the shop, for example `CROATIA`.
2	**Shopify Admin URL**	The store's `*.myshopify.com` address, for example `https://croatia-test.myshopify.com`. The connector corrects the URL format when you leave the field.
3	**Enabled**	Turn it on. Business Central first asks for **privacy consent** (data leaves BC for Shopify). After that it requests an access token, and Shopify shows the app-install screen.

#	Action
1	**I accept** confirms the consent. *Cancel* leaves **Enabled** off.

The person who owns the store accepts both the consent dialog and the Shopify install screen.

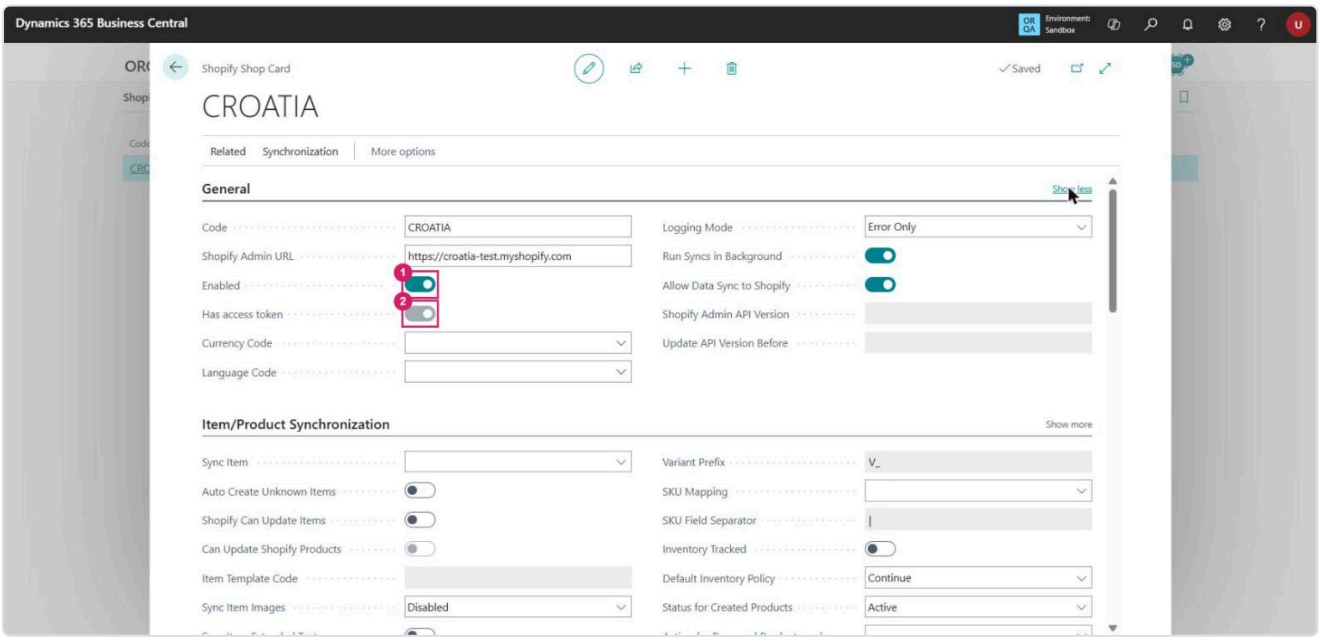

In a sandbox, HTTP calls must be allowed first. BC blocks outbound HTTP calls from every extension in a non-production environment. Turning on **Enabled** then fails with "*Shopify connector is not allowed to make HTTP requests when running in a non-production environment.*"

#	Action
1	Select the red error icon next to **Enabled**, then choose **Allow HTTP requests**. The same setting is in **Extension Management** → **Shopify Connector** → **Configure** → **Allow HttpClient Requests** (Microsoft Learn: Troubleshooting).

Enabled goes back to off. Turn it on again: the consent dialog appears again, then the Shopify install pop-up. The browser must allow pop-ups from `businesscentral.dynamics.com`.

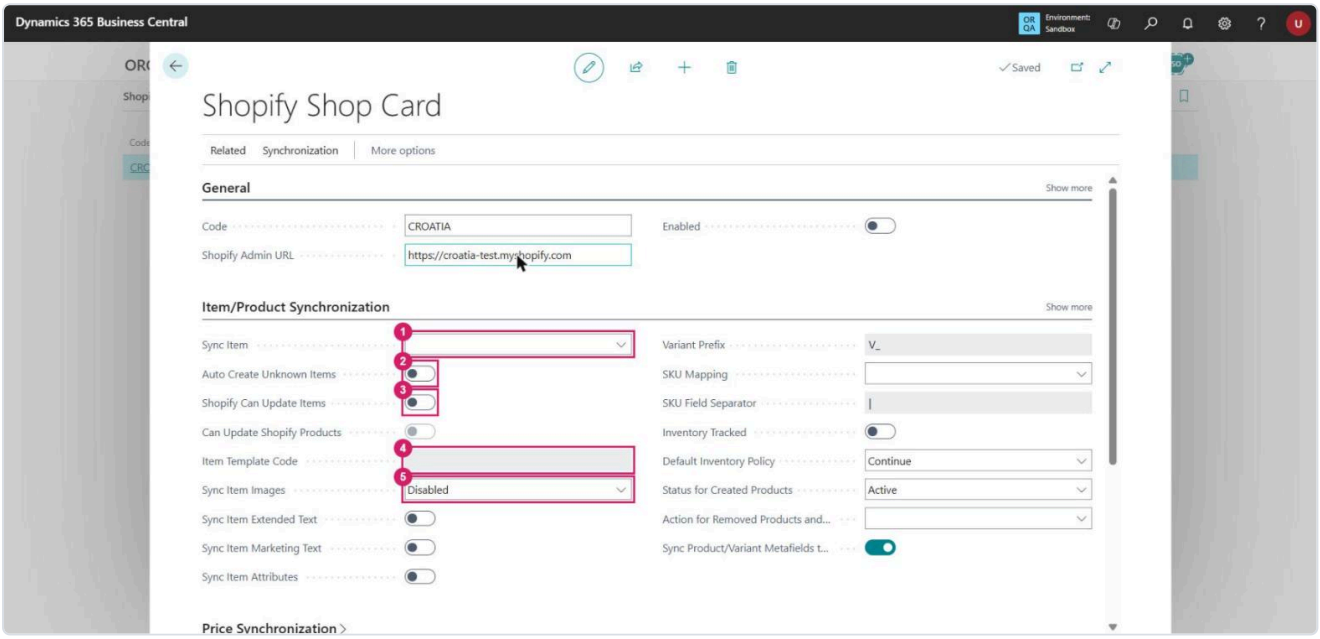

Check the connection: under **General** → **Show more**, **Has access token** must be on.

#	Field	Connected state
1	**Enabled**	On
2	**Has access token**	On (read-only)

Request Access gets a new token, and **Test Connection** checks that the token works. Both actions are on the card.

3. Products and inventory

#	Field	What it does	CROATIA
1	**Sync Item**	Direction of item sync: *To Shopify* (BC is the source) or *From Shopify* (Shopify is the source).	**From Shopify**
2	**Auto Create Unknown Items**	Creates an item in BC when a Shopify product has no matching item.	On, if Shopify is the product master
3	**Shopify Can Update Items**	Lets Shopify overwrite BC items during the sync. It cannot be on together with *Can Update Shopify Products*: turning one on turns the other off.	On, for *From Shopify*
4	**Item Template Code**	Template used for items created by row 2. The field is marked mandatory.	Your item template
5	**Sync Item Images**	*Disabled*, *To Shopify* or *From Shopify*.	*From Shopify*

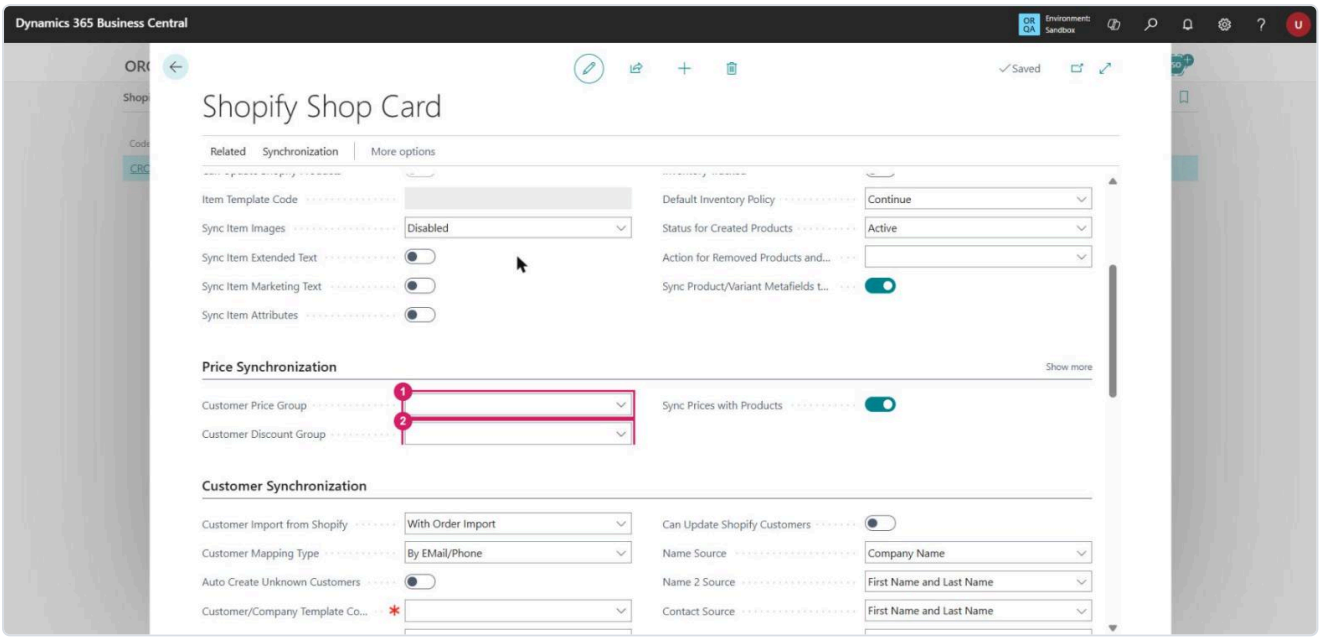

On the right-hand side of the same section:

- **SKU Mapping** decides how a Shopify SKU matches a BC item or variant.
- **Inventory Tracked** lets BC manage stock in Shopify.
- **Default Inventory Policy** is *Continue* (stock may go negative) or *Deny* (it may not).

Inventory by location: choose **Related** → **Locations** (see step 9) and fill in **Default Location Code** and **Location Filter**. The location filter sets which BC locations count towards the stock sent to Shopify. **Stock**

Calculation sets how that stock is calculated.

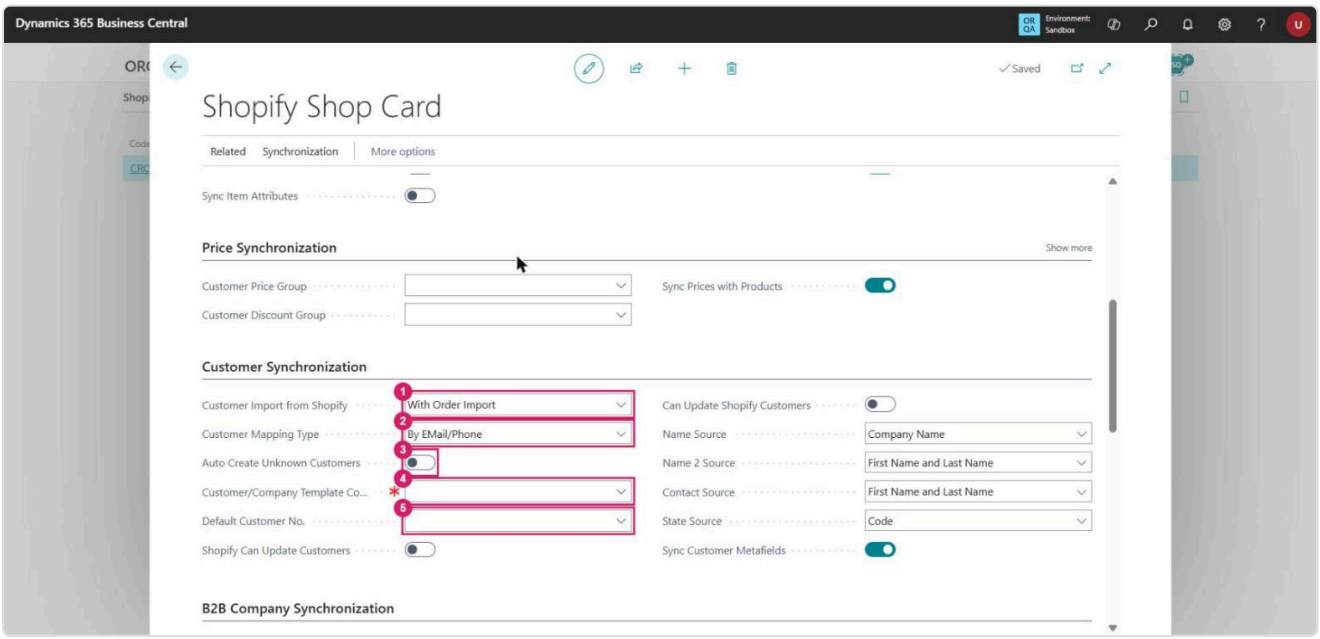

4. Prices

#	Field	What it does
1	**Customer Price Group**	Price group used to calculate the prices sent to Shopify.
2	**Customer Discount Group**	Discount group used in the same calculation.
—	**Sync Prices with Products**	Sends prices together with the product sync.

With *Sync Item = From Shopify*, prices are maintained in Shopify, and these fields matter only if BC pushes prices back.

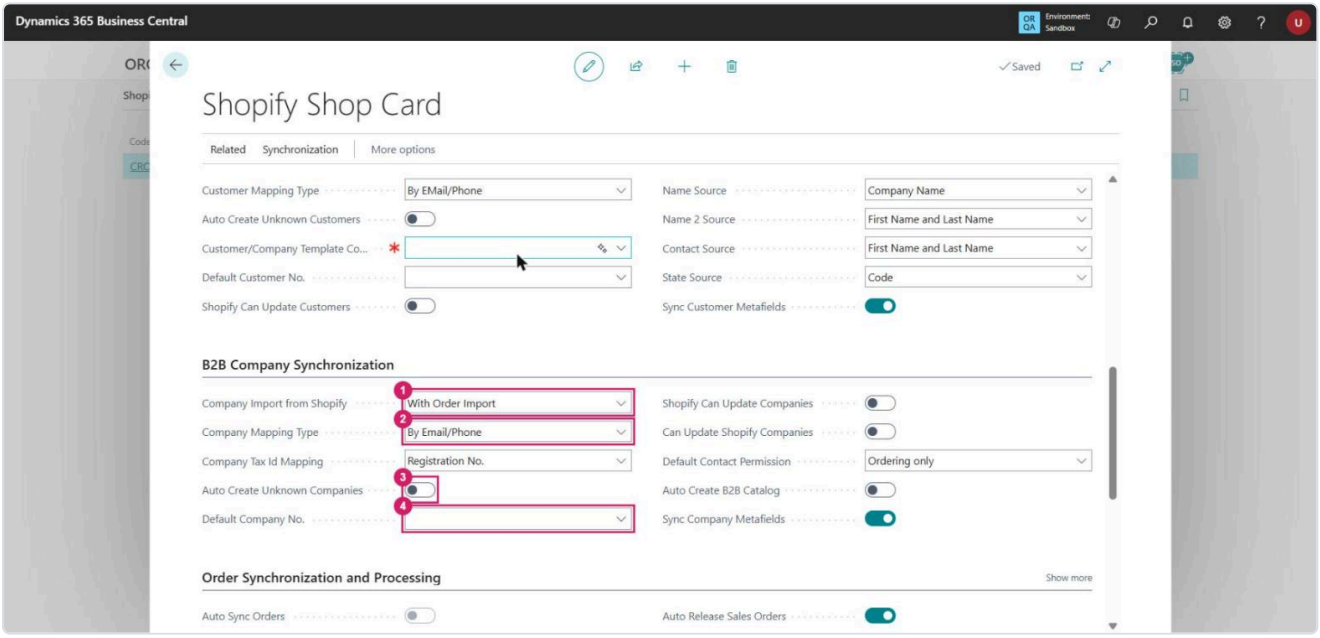

5. Customers

#	Field	What it does
1	**Customer Import from Shopify**	When customers are imported, for example *With Order Import*. With *None*, an order whose customer has no mapping uses the default customer (row 5).
2	**Customer Mapping Type**	How a Shopify customer is matched to a BC customer, for example *By EMail/Phone*.
3	**Auto Create Unknown Customers**	Creates a BC customer when no match is found.
4	**Customer/Company Template Code**	Template for created customers and companies. **Mandatory** (red asterisk).
5	**Default Customer No.**	The customer used when you do not create one BC customer per web-shop user.

Customer Setup by Country/Region (step 9) can give each country its own template.

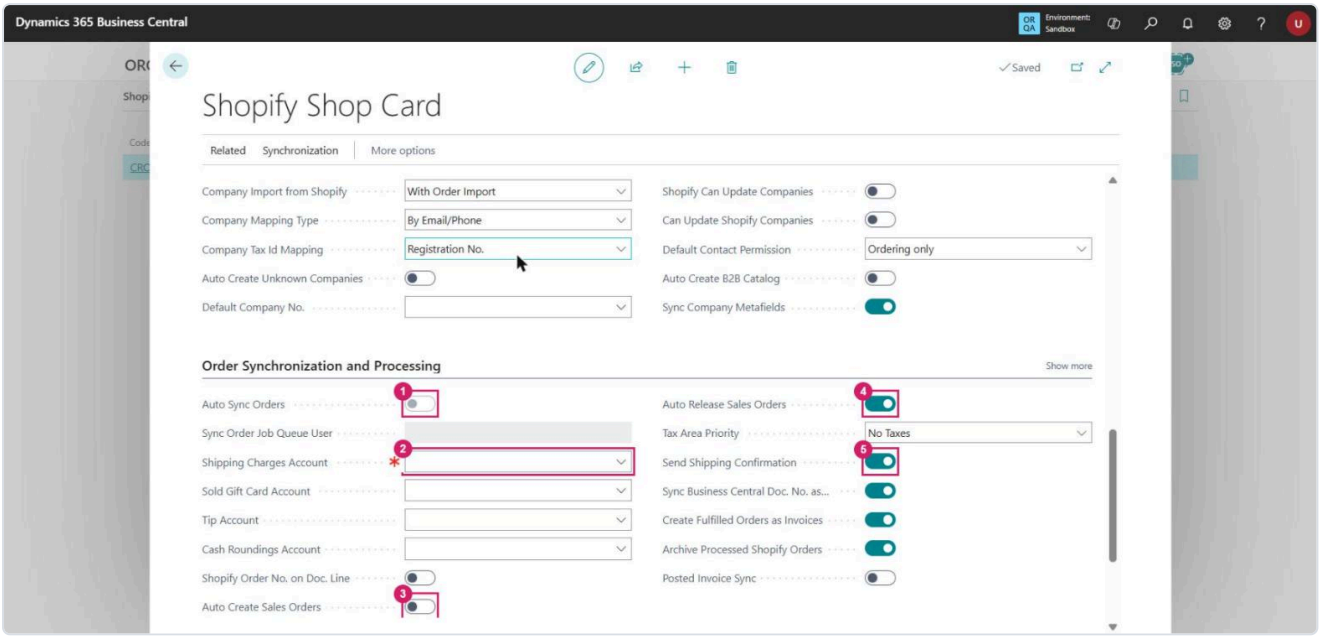

6. B2B companies

#	Field	What it does
1	**Company Import from Shopify**	When Shopify B2B companies are imported.
2	**Company Mapping Type**	How a Shopify company is matched to a BC customer.
3	**Auto Create Unknown Companies**	Creates a BC customer for an unknown company.
4	**Default Company No.**	The customer used when you do not create one per B2B company.
—	**Auto Create B2B Catalog**	Creates a catalog automatically for each new company.

Catalog pricing is managed under **Related** → **B2B Catalogs**.

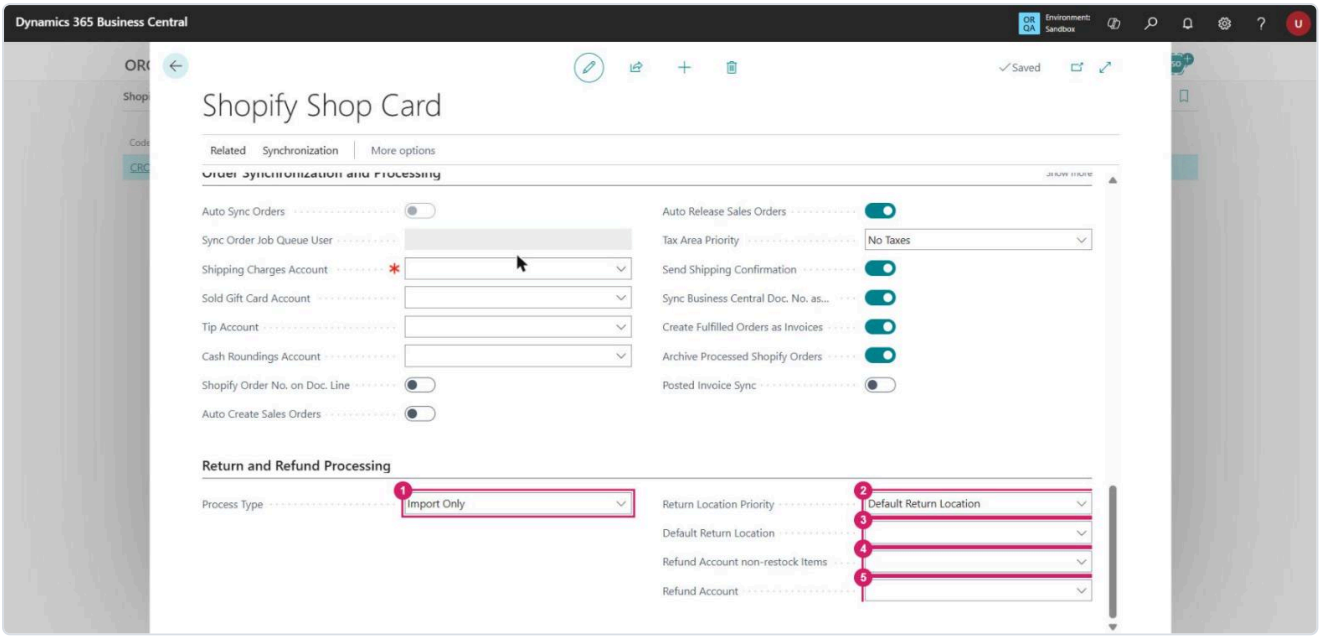

7. Orders

#	Field	What it does
1	**Auto Sync Orders**	Shopify notifies BC when an order is created, and BC schedules *Sync Orders from Shopify* on the job queue. The job runs as the user who turns this on. It can be changed only when the shop is enabled.
2	**Shipping Charges Account**	G/L account for shipping cost lines. **Mandatory.**
3	**Auto Create Sales Orders**	Creates BC sales documents from imported Shopify orders.
4	**Auto Release Sales Orders**	Releases the sales order after it is created.
5	**Send Shipping Confirmation**	Notifies the customer when the shipment is synced to Shopify.

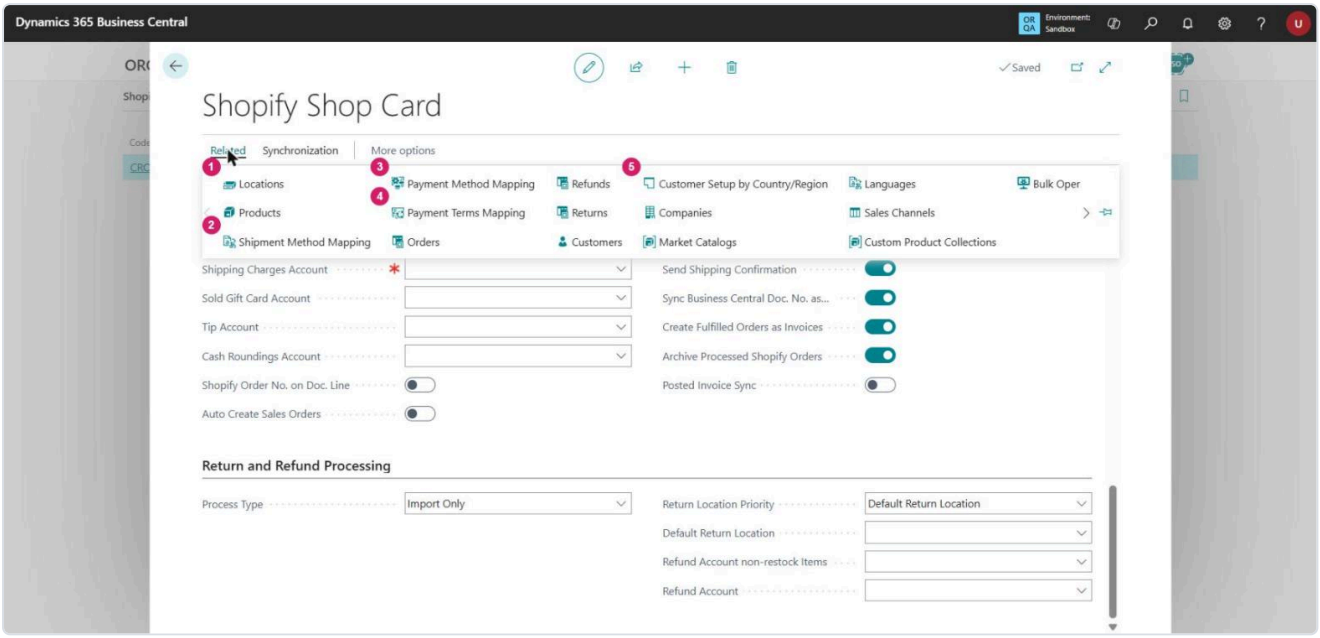

Also set **Sold Gift Card Account**, **Tip Account** and **Cash Roundings Account** if the store uses gift cards, tips or cash rounding.

8. Returns and refunds

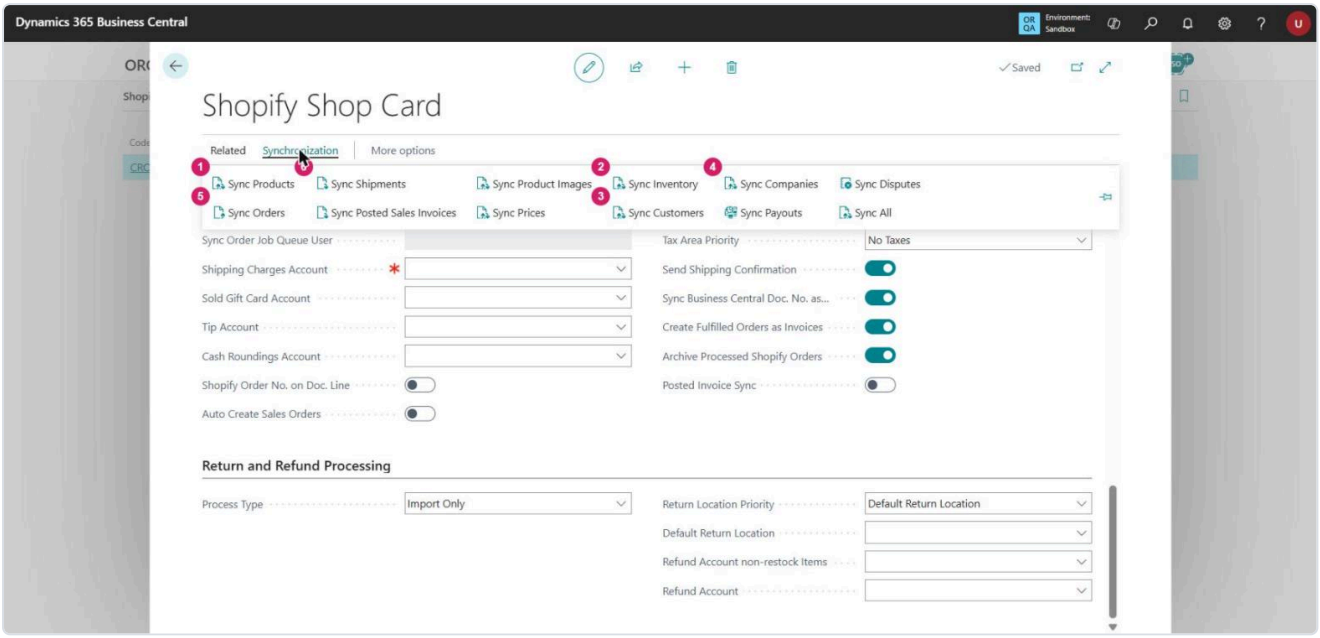

#	Field	What it does
1	**Process Type**	*Import Only* by default. *Auto Create Credit Memo* requires **Auto Create Sales Orders** (step 7) to be on, and the connector raises an error otherwise.
2	**Return Location Priority**	Where returned items go: *Default Return Location*, or *Original -> Default Location* (the original location first, then the default one).
3	**Default Return Location**	Location used for returned items.
4	**Refund Account non-restock Items**	G/L account for refunds of items that are not restocked.
5	**Refund Account**	G/L account for other refund lines.

9. Mappings

#	Page	What to map
1	**Locations**	Shopify locations ↔ BC locations (default location, location filter, stock calculation). Fill it after the first connection: the connector reads the locations from Shopify.
2	**Shipment Method Mapping**	Shopify shipping methods ↔ BC shipment methods and shipping agents.
3	**Payment Method Mapping**	Shopify payment gateways ↔ BC payment methods.
4	**Payment Terms Mapping**	Shopify payment terms ↔ BC payment terms.
5	**Customer Setup by Country/Region**	Customer template per country.

10. First synchronization

Run them in this order, so that each sync finds the records it depends on:

1. Sync Products → 2. Sync Inventory → 3. Sync Customers → 4. Sync Companies → 5. Sync Orders → 6. Sync Shipments

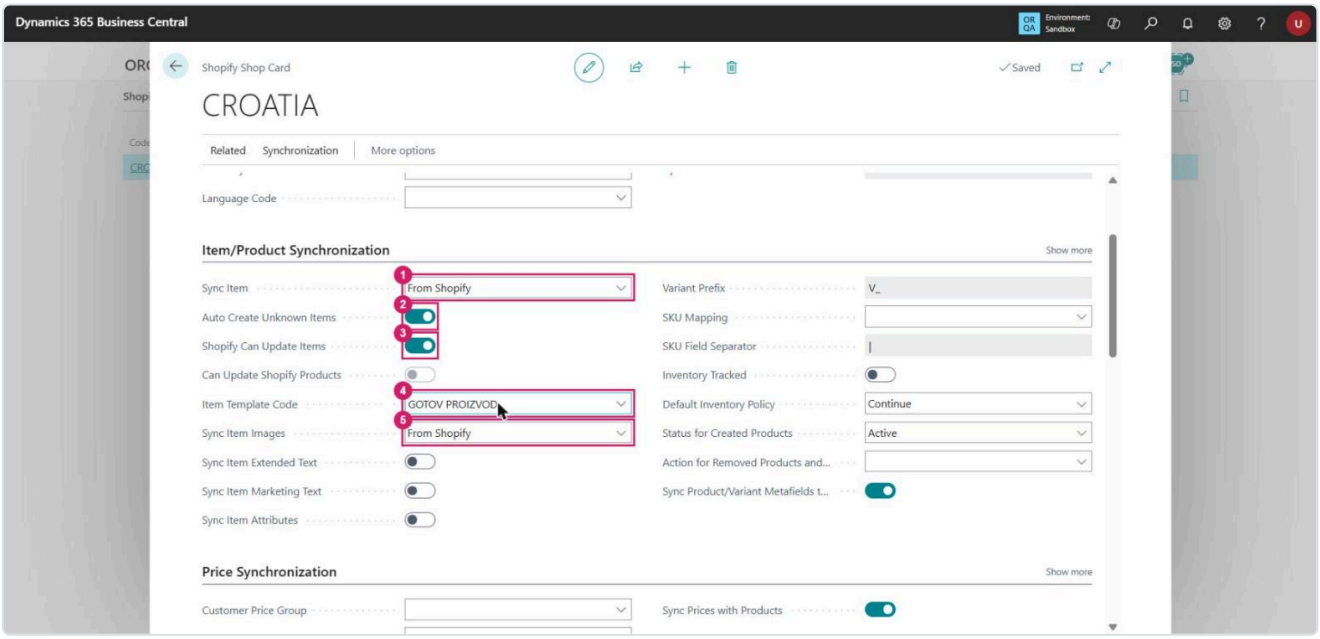

#	Action	What it does
1	**Sync Products**	Imports or exports products, in the direction set in step 3.
2	**Sync Inventory**	Updates stock levels.
3	**Sync Customers**	Imports or exports customers.
4	**Sync Companies**	B2B companies.
5	**Sync Orders**	Imports Shopify orders.
6	**Sync Shipments**	Synchronizes shipments to Shopify.

Allow Background Syncs (under **General** → **Show more**) runs syncs in the background. Turn it off while you test, to see progress and detailed errors.

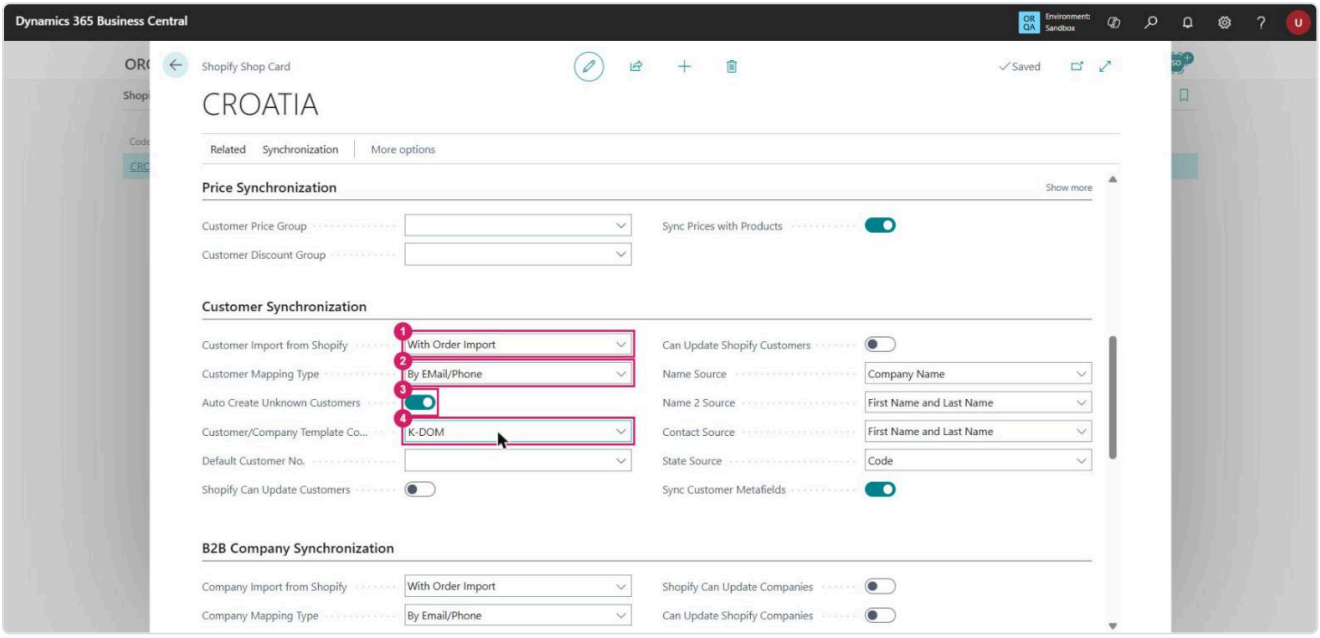

Part 2 — First-time setup: the worked example

These are the values set on shop `CROATIA` in the ORQA sandbox, with Shopify as the product master. Use them as a starting point and replace the codes with your company's own.

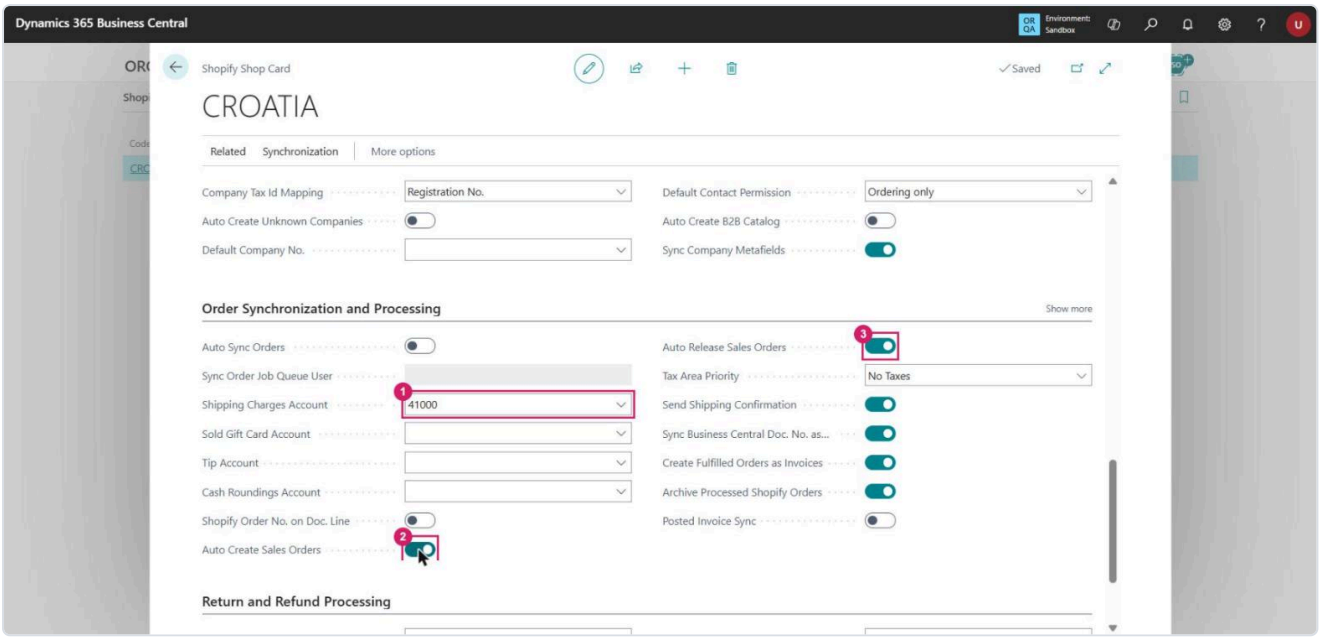

Area	Field	Value used	Why
Items	Sync Item	From Shopify	Products are maintained in Shopify
Items	Auto Create Unknown Items	On	First import creates the items
Items	Shopify Can Update Items	On	Later changes in Shopify flow to BC
Items	Item Template Code	`GOTOV PROIZVOD`	The company's finished-goods template
Items	Sync Item Images	From Shopify	Images come with the products
Customers	Auto Create Unknown Customers	On	Web-shop buyers become BC customers
Customers	Customer/Company Template Code	`K-DOM`	Domestic customers
Orders	Shipping Charges Account	`41000`	**Sandbox test only.** It is an expense account; use a revenue account in production
Orders	Auto Create Sales Orders	On	Imported orders become sales orders
Locations	Default Location Code / Location Filter on *Shop location*	`WH500C`	Central finished-goods warehouse
General	Run Syncs in Background	Off	Shows sync results directly while testing

#	Field	Value
1	Sync Item	From Shopify
2	Auto Create Unknown Items	On
3	Shopify Can Update Items	On
4	Item Template Code	`GOTOV PROIZVOD`. In the test, the field became editable and mandatory once rows 1–3 were set.
5	Sync Item Images	From Shopify

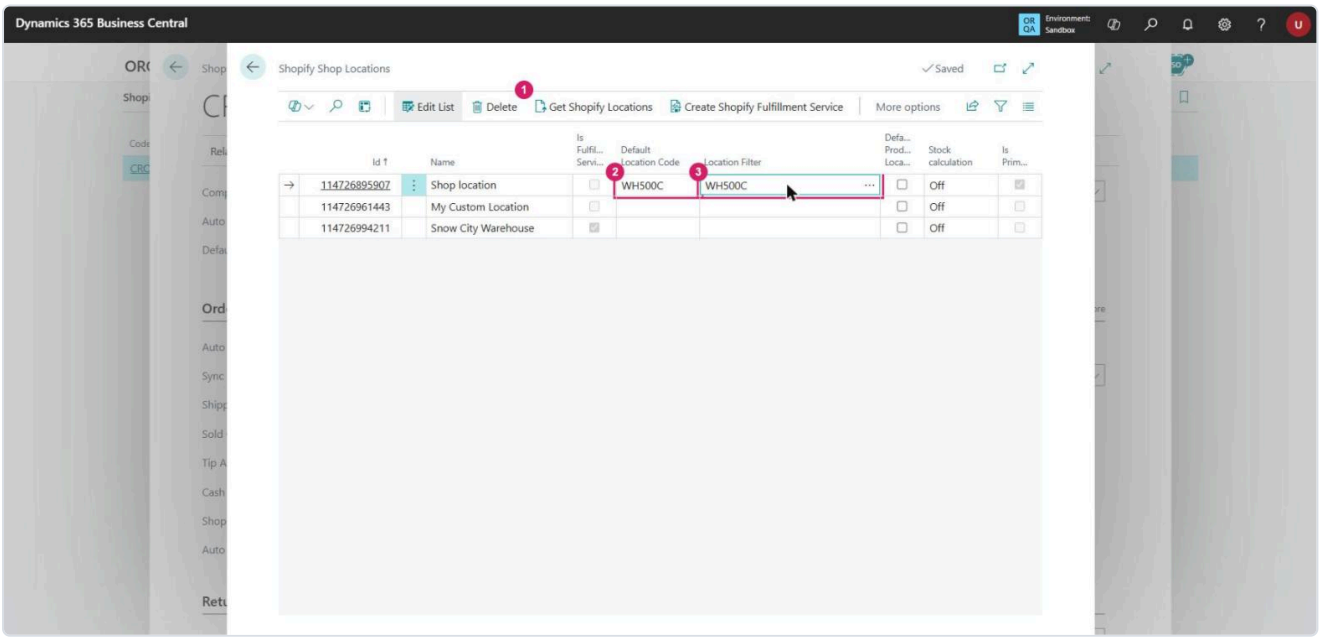

#	Field	Value
1	Customer Import from Shopify	With Order Import (default)
2	Customer Mapping Type	By EMail/Phone (default)
3	Auto Create Unknown Customers	On
4	Customer/Company Template Code	`K-DOM`

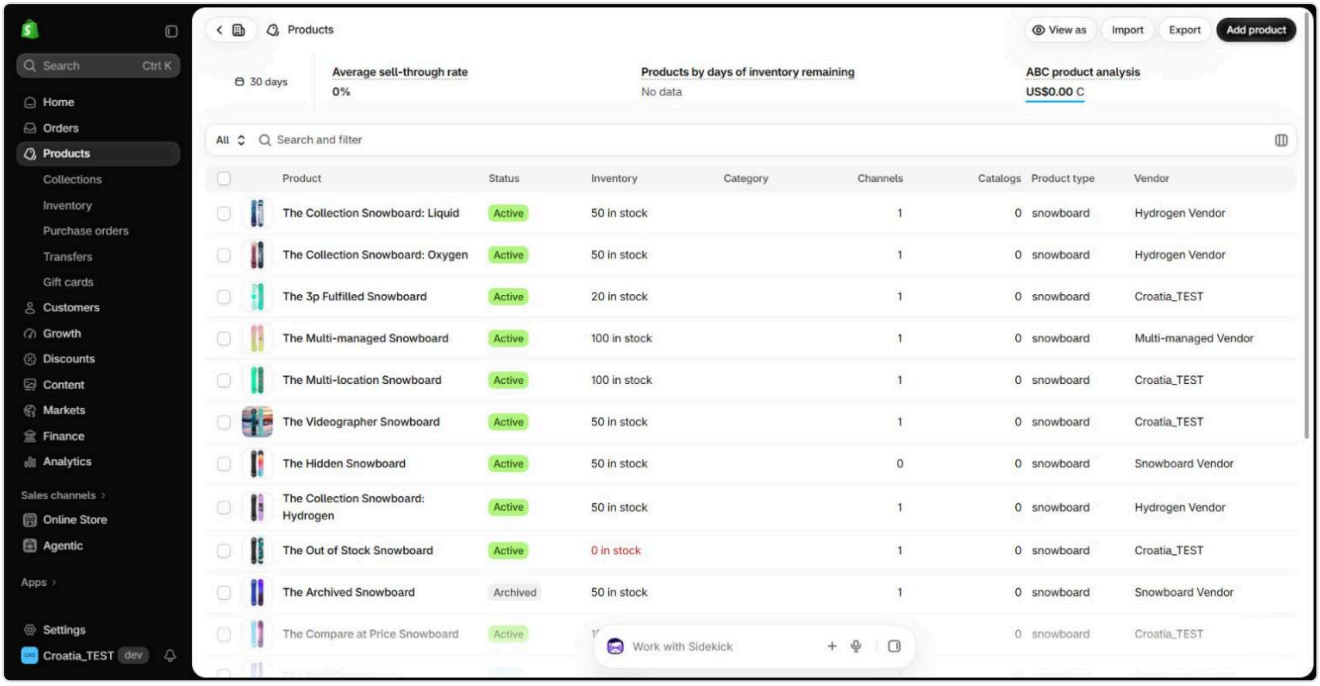

#	Field	Value
1	Shipping Charges Account	`41000`
2	Auto Create Sales Orders	On
3	Auto Release Sales Orders	On (default)

Locations. Open **Related** → **Locations** and choose **Get Shopify Locations**. The connector reads the store's locations: here *Shop location* (primary), *My Custom Location* and *Snow City Warehouse* (a fulfillment service). Choose **Edit List** and map the primary location:

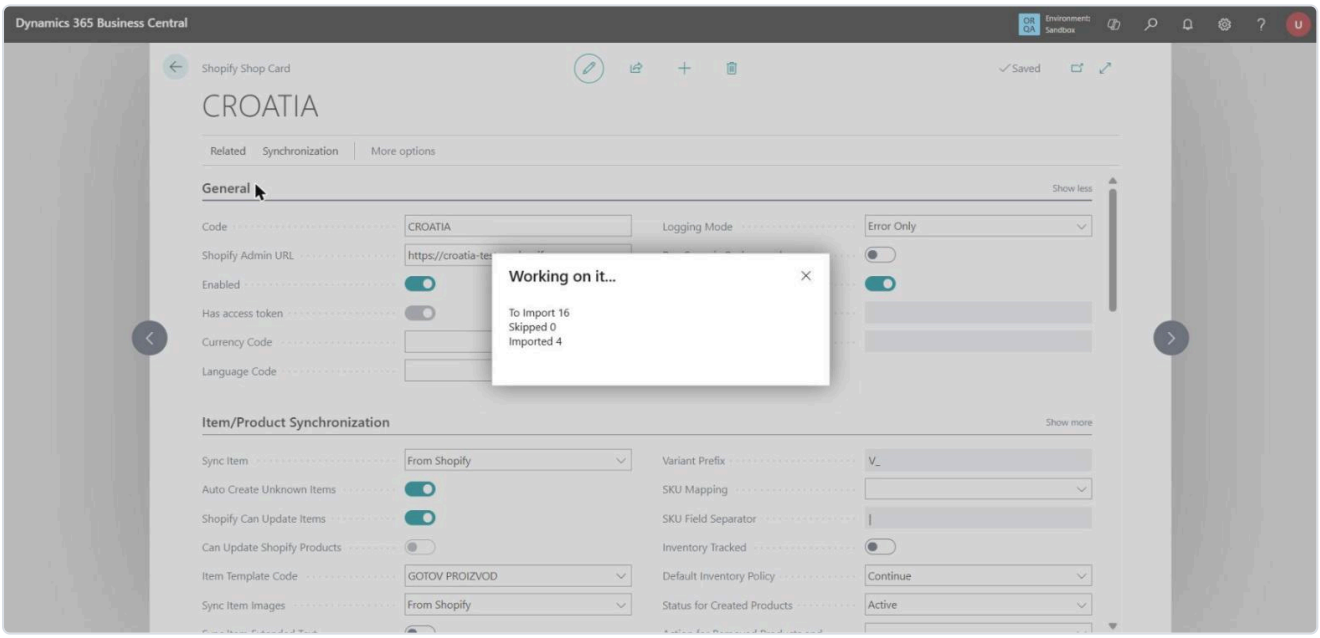

#	Field	Value
1	**Get Shopify Locations**	Reads the locations from Shopify
2	Default Location Code	`WH500C` : the location put on order lines
3	Location Filter	`WH500C` : the location(s) whose stock is counted for Shopify

First product import. The dev store already contains Shopify's demo products:

On the Shop card, choose **Synchronization → Sync Products**. With *Sync Item = From Shopify*, BC imports them (16 in this store) and creates items from the item template:

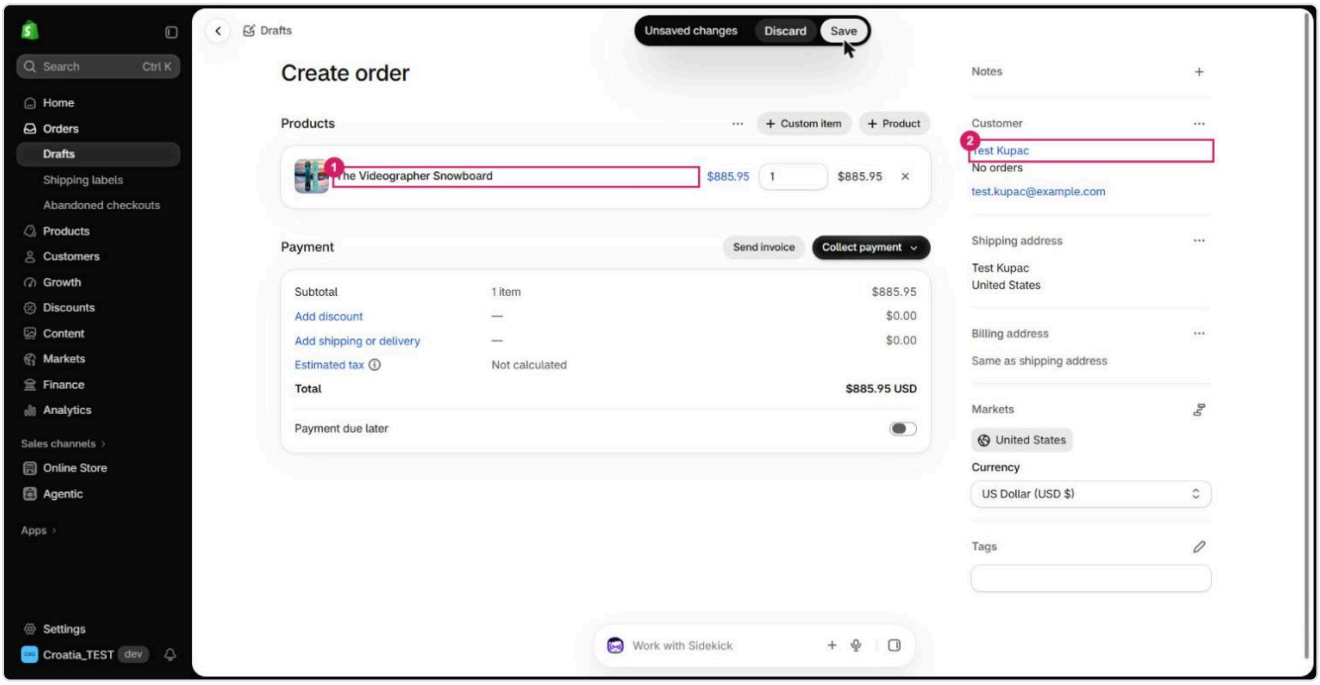

Part 3 — Test an order end to end

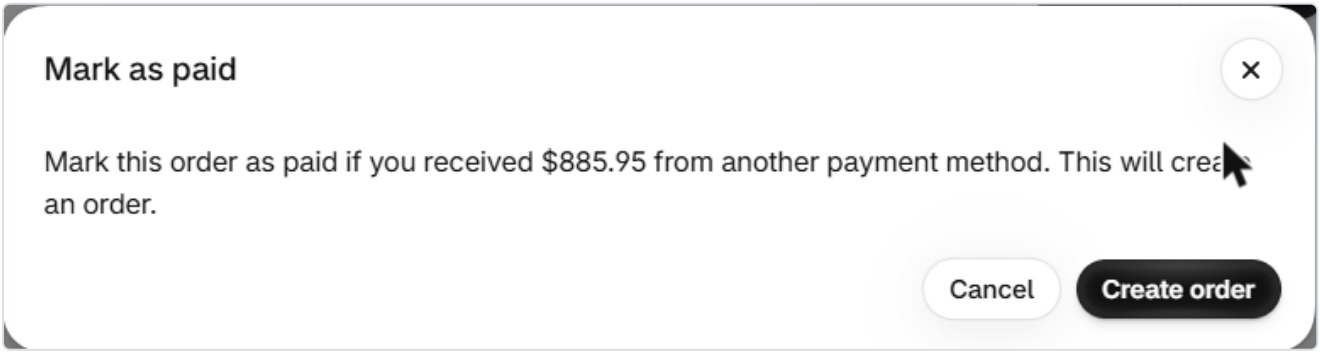

Shopify: draft order → Mark as paid → order #1001 → BC: Sync Orders → Shopify Orders list → Sales order created

3.1 Create a test order in Shopify

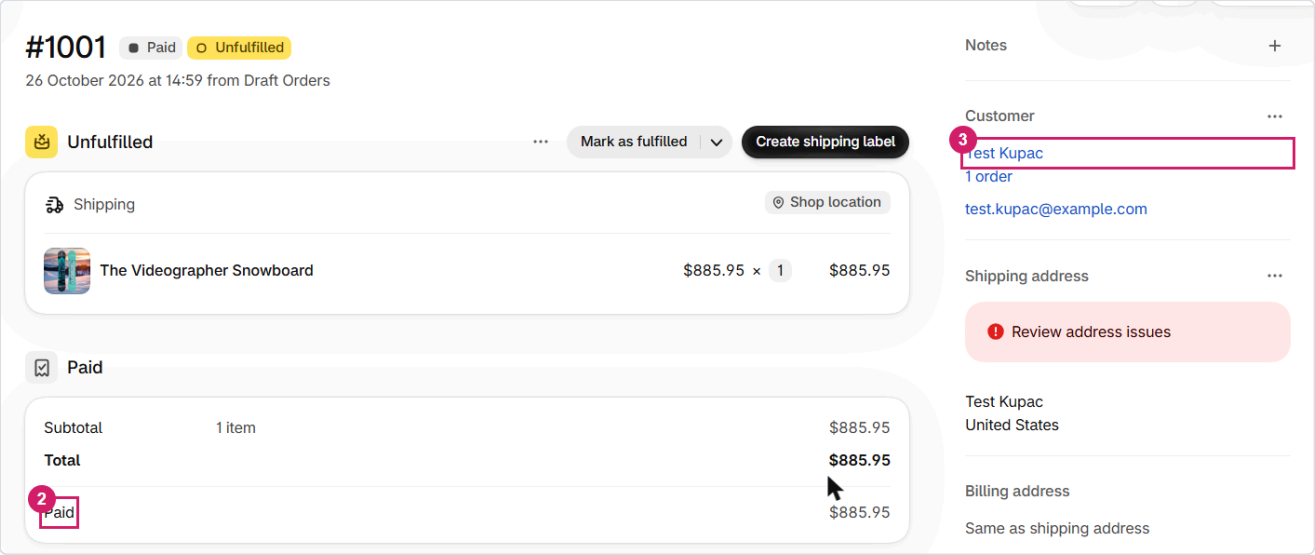

In Shopify admin, open **Orders** → **Drafts** → **Create order**:

#	Action
1	**+ Product**: add a product that was imported in Part 2 (here *The Videographer Snowboard*).
2	**Customer**: choose *Create a new customer* and use invented data (here *Test Kupac*, `test.kupac@example.com`).
—	Then choose **Collect payment** → **Mark as paid**.

Create order turns the draft into a real order. **Mark as paid** records the payment without a payment gateway, so no card details are needed.

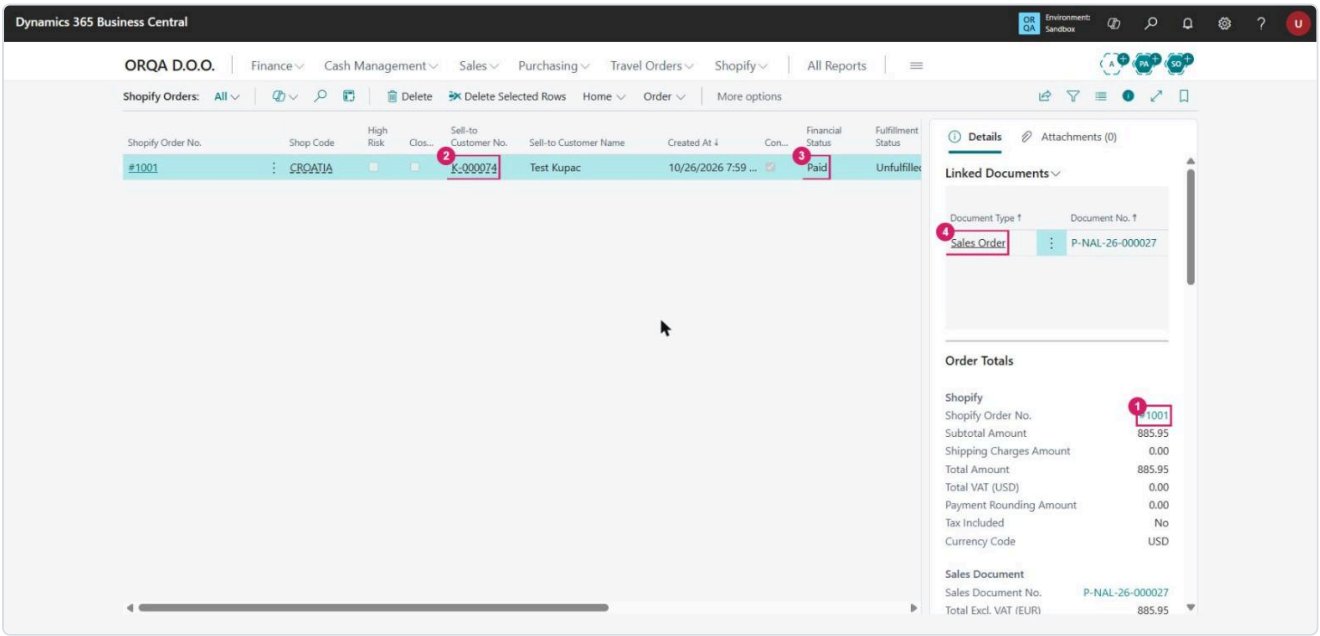

#	What to check
2	Payment status **Paid**
3	Customer **Test Kupac**

The order number (`#1001` here) is shown at the top.

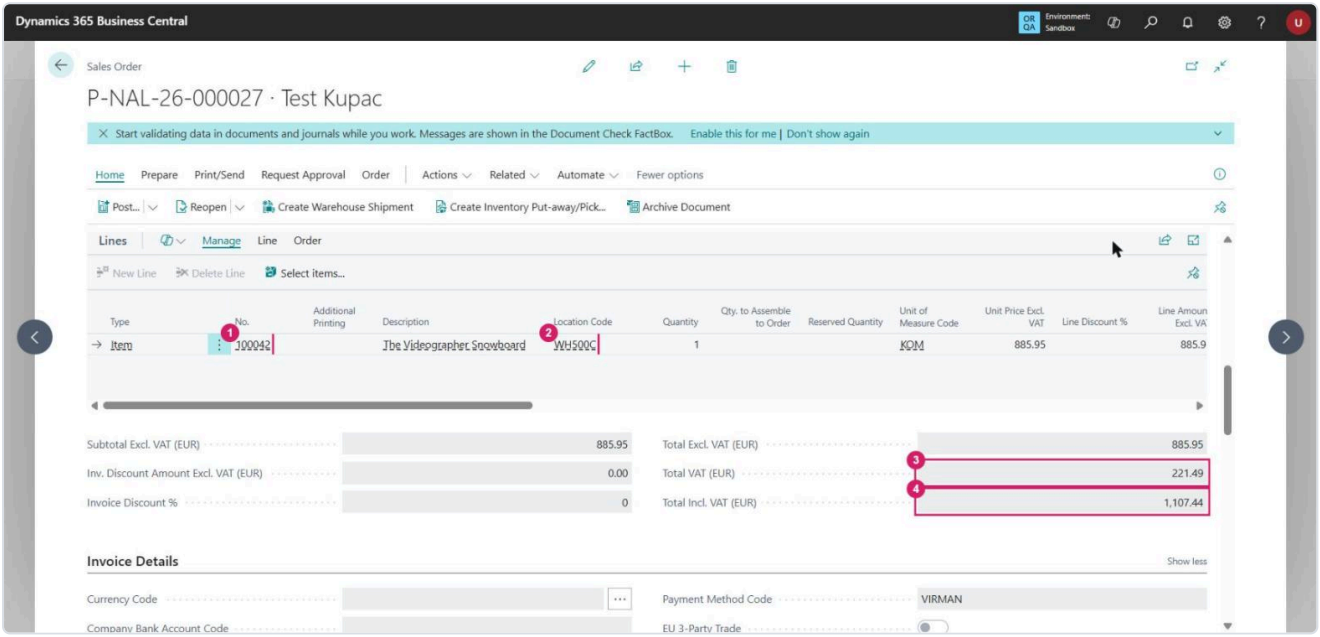

3.2 Import the order into BC

On the Shop card, choose **Synchronization** → **Sync Orders**, leave the filters as they are (shop `CROATIA` is prefilled), and choose **OK**. Then search for **Shopify Orders**:

#	What it shows
1	Shopify order `#1001`
2	Customer **K-000074**, created from template `K-DOM` because *Auto Create Unknown Customers* is on
3	Financial status **Paid**
4	Linked document: **Sales Order** `P-NAL-26-000027`, created because *Auto Create Sales Orders* is on

3.3 Check the sales order

#	What to check	Result in the test
1	Item	`100042` *The Videographer Snowboard*, the item created by the product import
2	Location Code	`WH500C`, from the location mapping
3	Total VAT	**221.49**: BC added 25 % VAT, but the Shopify order had no tax
4	Total Incl. VAT	**1,107.44**, versus 885.95 paid in Shopify

The order arrives **released**, because *Auto Release Sales Orders* is on.

3.4 What the test showed: fix before go-live

Finding	Seen in the test	What to do
Currency	The Shopify order is in **USD 885.95**; the BC order shows **885.95 EUR**. The shop's **Currency Code** is blank, and the field's tooltip says to leave it blank only when the store uses the local currency.	Either set the store's currency to EUR in Shopify, or set **Currency Code** = `USD` on the Shop card and maintain USD exchange rates.
VAT	The BC total (1,107.44) does not match the Shopify total (885.95). The Shopify order had no tax and is not tax-included, and BC calculated 25 % VAT on top.	Decide with the customer whether Shopify prices include VAT, and align Shopify's tax settings and the VAT posting setup that the customer template brings.
Inventory posting	After the product and order syncs, BC showed *"Inventory Account is missing in Inventory Posting Setup"*.	Complete **Inventory Posting Setup** for location `WH500C` before posting a shipment.
Customer country	The test customer got Country/Region `US`, because the draft order used Shopify's *United States* market and no address was entered.	Enter a full address on test orders, and set up the store's markets for Croatia.
